

OutSystems® Platform

Deliver amazing enterprise applications that are built to change at the speed of business.

OutSystems addresses a \$2 Trillion IT problem – the 80-85% of total IT spend that is used for Keeping The Lights On (KTLO). This investment in application maintenance, change requests and general systems operations leaves no room for IT to help the business innovate, which causes many companies to suffer from ‘Shadow IT’ initiatives, where business teams build applications without IT’s involvement.

OutSystems is the only application delivery platform that builds applications that are ‘change ready’, inherently secure, mobile ready, generated as native Java or .Net applications, and can be deployed in the cloud or on premise.

What is it for?

You can use the OutSystems® Platform to deliver **custom web and mobile applications that are unique to your business** and that can be constantly changed to align with business requests, while shrinking your maintenance costs.

What’s different about it?

OutSystems addresses the **core problem of continuous application change**. It works on top of your favorite middleware stack and scales from small apps to large enterprise installations with thousands of users

Why do you need it now?

You’ll respond to business requests faster without growing your maintenance and operational costs. This will allow you to effectively address your backlog of requests for new applications and business functionality and reduce the cost of “keeping the lights on”.

As a result you will **transform your IT organization into an innovation driver**, with no big upfront investments, one application at a time.

“Adopting OutSystems Platform resulted in the fastest application development project ever for this company.”

AD of Software Development at XDx Inc.

“OutSystems championed an innovative approach with an advanced platform that can significantly improve the time to market and quality of business applications.”

Michael Azoff, Senior Research Analyst at Butler Group

The OutSystems Platform is used by many of the world’s most respected companies including:

OutSystems® Platform

The OutSystems® Platform is a complete application lifecycle system to develop, manage and change enterprise web and mobile applications.

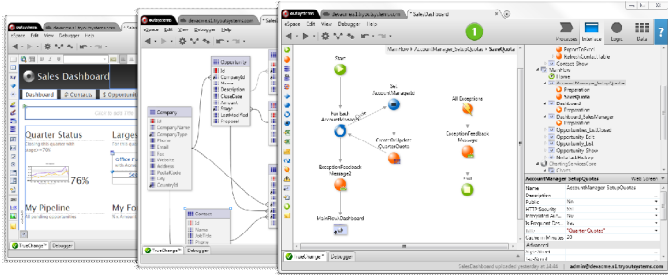

It works on top of your standard middleware stacks and scales from small applications to large enterprise installations with hundreds of thousands of users.

The platform combines high productivity, change management and full application lifecycle capabilities to enable your IT department to address the core problem of continuous application change.

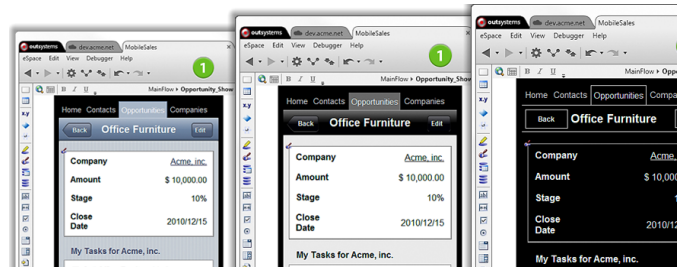

Build Enterprise Applications Faster & Better

Get a complete IDE to visually create and change all layers of an application: Rich Web Interfaces, Business Processes, Business Logic, Databases, Web Services, and Batch Processes. This fully integrated approach, together with a sophisticated impact analysis engine, can make your teams 10.9x more productive. You'll create robust architectures that support your core business and applications that scale to millions of users.

Build rich web & mobile interfaces for all devices

Using a WYSIWYG visual editor, you can create and change rich web interfaces providing great UX to your users. Incorporating the latest advances in HTML5, CSS3 and JavaScript, you can use modern, native-looking, UI widgets to produce codeless Ajax interactions. Reuse your business logic to create beautiful mobile and tablet web applications that run in iOS, Android, Windows or Blackberry, from a single code base.

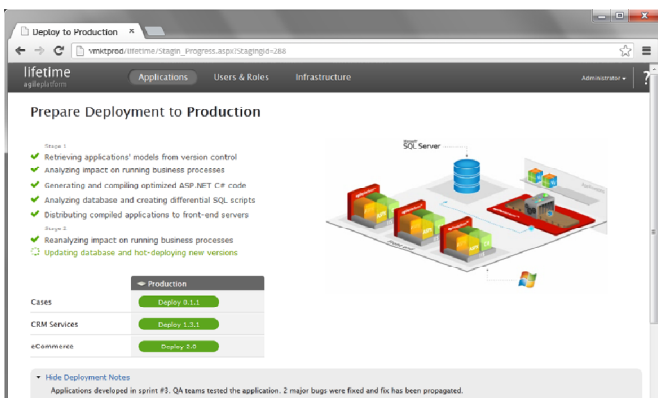

Extend your existing systems and make your systems of record change safe

Use pre built integration adapters, or create your own. Run wizards to access SAP data, connect to existing databases, access data from web services, read and transform files. Deploy your connectors once and reuse them across your applications. You will lower the cost of maintenance for your legacy systems, reduce your technical debt, and have the ability to quickly react to changes – without having to change your core systems!

Automated Build and Staging processes across environments

The OutSystems Platform automates all application deployment processes across multiple environments, up to Production farms. It keeps track of database changes, dependencies between applications and services, and prevents you from deploying inconsistent versions. This dramatically reduces errors, lowers costs, and allows for faster and robust change cycles.

Change Your Applications with Zero Risk

Change applications faster, decrease maintenance costs, and ensure that, no matter how big the change, your applications will always be architecturally sound and working. The platform tracks all dependencies and pinpoints the impact of a change across all layers of your application. It heals the sections that can be automatically corrected and tells you about the required manual corrections.

Built-in performance management for all applications

Applications built with the platform are automatically instrumented for usage and performance monitoring using a queue-based asynchronous logging service. Built-in reports help you identify application errors and performance issues in integration, database and queries, and Measure your users experience and ensure performance even as application usage grows.
