

Note Scenario::

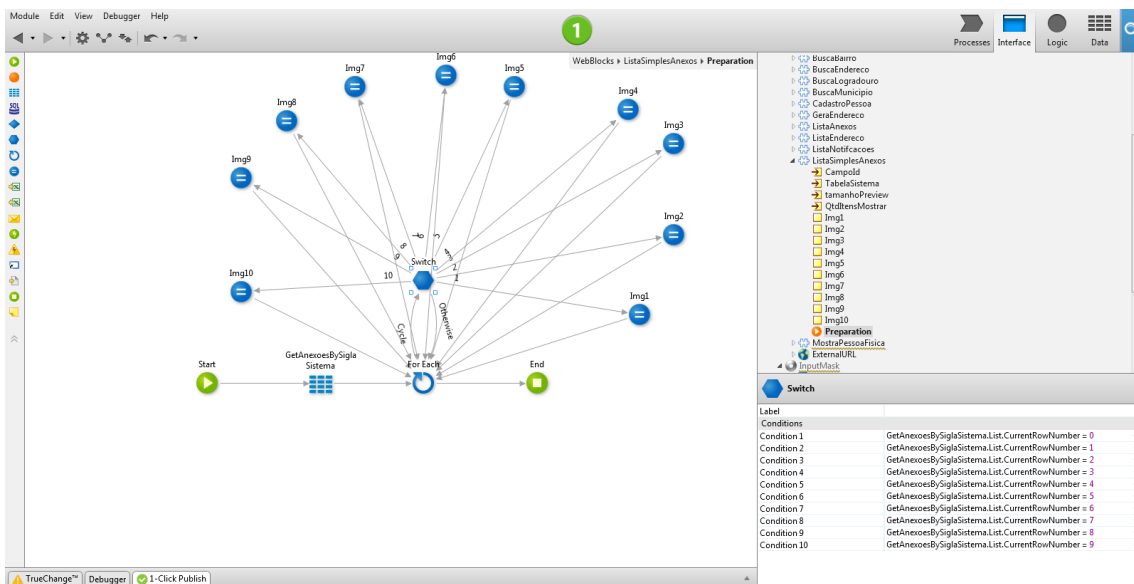

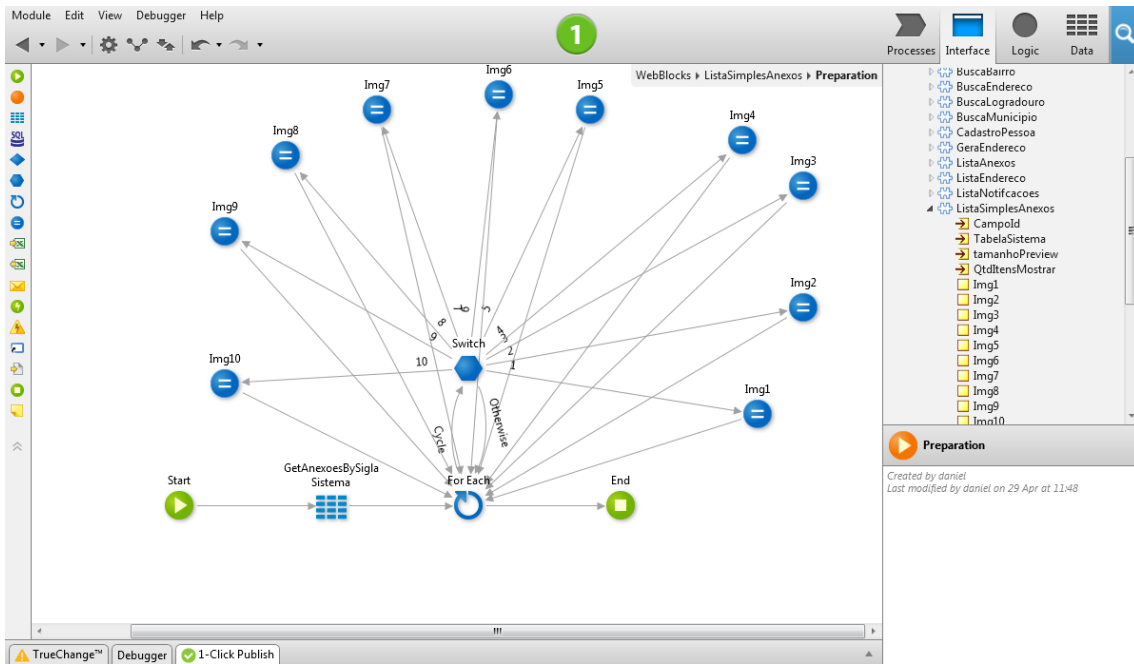

- 1) upload the file to a folder
- 2) generates the file url
- 3) have an attached table where records the Id, description and Url file

4) now make the thumbnails

As a record can have multiple images then the preparation takes the first 10 images and makes for each variable - img1, img2, img ... get a url that will be displayed in each of the images.

The idea here is to take 10 images related to an Id (for example a person can have images such as documents, family photos, etc.) and place each image in a variable imgxx and that webblok shows the list
